SafeContractor

Investors In People – Gold

ISO 9001 and 14001

ISO 45001 Safety Standard

IP180093DS 081019

Concrete Structures

CONCRETE STRUCTURES

An unexpected impact on your subsea structure can be catastrophic.

Even if the collision is discovered immediately it can take weeks and large amounts of money to repair. Unseen damage can be even worse.

Our bespoke Concrete Structures are designed to prevent these subsea impacts and to keep your business running smoothly. A combination of patented designs and our high quality construction give you reliability and peace of mind.

We create the structures to your specification or, if you'd prefer, use our expertise and experience to advise you on the best design for your installation site.

Either way, every structure is tailored to the specific conditions of the site ensuring that each installation is securely protected.

Our Impact Protection Covers are designed to resist the dynamic effects of striking objects by absorption and compliance. Designed to comply with the relevant BS EN concrete codes and DnV Rules, these are normally designed as gravity based structures which need no additional foundations, meaning they are easy to install.

Weighted Collars

Toe-head corner protection blocks

Our pipeline supports protect your pipes on their journey across the seabed.

We construct sleepers, bridges, weight collars, turning bollards, and rigid bearing units that support and safeguard.

Pipeshield's in-house design team can design & manufacture bespoke concrete solutions.
